

## FOXNET

### *AI Influencer OS - Admin Panel*

This document outlines everything included in the admin panel we are building. It covers all pages and features.

### **What we are building**

The admin panel is the private web application our client uses to control the entire FOXNET system from one screen. It connects to an automation engine. The Client can see what is running, approve content, manage all 20 personas, fire community blasts, and launch product campaigns - without touching any backend system directly.

### **Pages & Features**

Every item listed under each page is included in this scope.

#### **01 Command Center - The Main Dashboard**

- Opens on login. Shows the live health of the entire system at a glance.
- 5 stat cards: Monthly Revenue, Active Personas, Total Followers, Content Today, Community Size.
- Upcoming content feed: next 6 hours of scheduled posts with platform, type, and countdown timer.
- API credit burn bars: usage percentage per AI service (Claude, ElevenLabs, Enhancer, Gemini, GPT).
- Workflow health list: each n8n workflow, when it last ran, and any error count.
- Master Pause button: stops all 20 persona pipelines simultaneously with one click.
- TRIGGER DROP button: visible on every page. Fires the SaaS Drop campaign immediately.

#### **02 Personas - Manage All 20 AI Influencers**

- Grid view of all 20 persona cards showing: name, niche, platform, status badge, followers, posts, monthly revenue, and time until next post.
- Three status types per persona: Active (running and posting), Building (being set up), Paused (manually stopped).
- Trigger Post button: fires that persona's pipeline immediately outside their normal schedule.
- Pause / Resume button per persona card.
- Add New Persona form (see full details below).
- Edit any existing persona - all fields editable.
- Delete persona with 30-day archive (data is not permanently lost).

## Main Feature - Add New Persona

Adding a new AI influencer is the most important feature in the panel. Admin fills one form - no coding, no database access. The form has 6 sections:

- **Identity** - Name, handle, niche, target audience, brand colour, avatar image, language
- **Persona Prompt** - The AI brain definition for this influencer. Tells Claude exactly how to write their scripts.
- **Voice Settings** - ElevenLabs Voice ID, stability slider, similarity boost slider.
- **Platforms and Schedule** - Which platforms to post to, daily post time, posts per day, active days.
- **Approval Mode** - Supervised (review before publish) or Full Auto (publishes on schedule).
- **Monetisation** - Affiliate link, product URL, Telegram group ID, WhatsApp group ID, Facebook group ID, Discord webhook.

## 03 Persona Detail - Deep Control Per Influencer

- Level 1 - Config Overview: read view of all settings. One click to open the edit form.
- Level 2 - Manual Script Injection: Admin writes his own script for the next pipeline run. Word counter and speech duration timer included. AI generation resumes automatically on the following run.
- Level 3 - Pipeline Controls: Trigger Post, Skip Today, Restart Pipeline, toggle Supervised or Full Auto mode, live pipeline stage tracker showing which of 8 stages is currently running, and last run summary.

## 04 Content Pipeline - Monitor and Approve

- Live view of all content currently in production with status: Rendering, Ready, Scheduled, or Waiting Approval.
- 7-day content calendar showing total posts scheduled per day.
- Platform distribution showing posts per day per platform.
- Approval Queue below the live view - every content piece waiting for review appears here.
- Five actions per queue item: Approve and Publish, Edit Script Inline, Inject Manual Script, Regenerate (ask AI to redo), Reject.
- Approve All button to clear the entire queue in one click.

## 05 Community Hub - Blast Management

- Shows total community reach, number of groups, average group size, and when the last blast was sent.
- Blast All 60 Groups button - sends the latest content to all Telegram, WhatsApp, and Facebook groups for all personas simultaneously. Requires confirmation before firing.
- Select Groups option - choose specific personas or channels to blast instead of all at once.
- Schedule Blast - set a future date and time for the blast to fire automatically.
- Per-persona table showing each influencer's group sizes (Telegram, WhatsApp, Facebook) and a Blast Now button per row.

## 06 SaaS Drop - Product Launch Manager

- Active drop banner showing the campaign name, scope, and countdown timer in days.
- Drop Readiness checklist: tracks what is ready and what is still pending before the launch (content generated, blast scheduled, landing page live, payment integration).
- Blast Targets panel: shows Ready or Pending status per channel type (Telegram, WhatsApp, Facebook, Email, YouTube Community, Instagram Stories).
- TRIGGER DROP button fires the SaaS Drop workflow: all 20 personas post the campaign content and all 60 community groups receive the blast simultaneously.
- Previous Drops history: revenue, conversion rate, and top performing niche for past campaigns.

## 07 Settings and Infrastructure - System Control

- Master Pause toggle - same as the topbar button, also available as a permanent setting.
- Default Approval Mode for new personas. Queue Alert Threshold (how long before Telegram alert fires).
- Notification preferences - Telegram alerts on/off for: pipeline failures, queue pending, publish confirmation, daily summary.
- Connection status - live health check for n8n, Supabase, Firebase, ElevenLabs, Enhancer.
- VPS health, CPU usage, total API spend this month, and total infrastructure cost.
- API costs breakdown per service with usage percentage and monthly cost.
- Infrastructure stack status - green or red dot for every service (n8n, Redis, Supabase, Qdrant, Vercel, Shopify, Gumroad, Printify).
- n8n workflow list - all active workflows with last run time and error count.

- Admin profile - signed-in Google account, sign out button.
- Team Access - Admin can add up to 3 Google accounts for team members. Only the primary Admin can manage this list. Added users have full read/write access to the panel.

### **Login - Google Auth**

Admin and Team Access (Max 4 Accounts). The primary Admin logs in with their Google account. The Admin can grant access to a maximum of 3 team members through a new "Team Access" section in Settings. Only authorized Google accounts can access the panel; all others are blocked automatically. After login, it redirects to the Command Center.

### **How It Connects to Our Automation Engine**

The admin panel is a separate application that connects to the same database our automation engine uses. Both systems share one database. When our automation generates content, it saves it to the database. The admin panel reads it and shows it in the queue. When Admin clicks Approve, the panel writes back to the database and the Automation engine system picks it up and publishes.

### **Future Scope - To Be Discussed Separately**

The following items are not part of this build. They require additional integrations or depend on the core system being stable and live first. These will be scoped and priced separately when the time comes.

### **Revenue Tracking Dashboard**

*Full revenue tracking across multiple platforms - Gumroad, Shopify, KDP, Etsy, BetterHelp affiliate, Beehive ads, Whop communities. Each requires its own API integration. Too many separate connections to include in the first build.*

### **Analytics and Performance Charts**

*Views, engagement rates, follower growth charts, content performance per persona and per platform. Needs several weeks of real data to be meaningful. Best built after the system has been running for 30+ days.*

### **Community Manager**

*AI-drafted replies to comments across platforms. Queued for one-click approval. Needs the core posting system to be running consistently before comment management is worth building.*
